AASEES BADESHA

aaseesbadesha13@gmail.com | aasees.dev | linkedin.com/in/aasees-badesha | github.com/aaseesb

SUMMARY

Software Engineering student with production full-stack and AI experience, building computer vision and robotics software.

EDUCATION

McGill University | B.Eng. Software Engineering **Aug 2024 – Apr 2029**

Wadad Stamboulie Entrance Award | GPA: 3.77/4.0

SKILLS

Languages: C++, Python, Rust, TypeScript, Java, SQL, Bash

Frameworks: React, Next.js, Node.js, FastAPI

Tools & Cloud: PostgreSQL, Docker, Google Cloud Run, GitHub Actions, Appium, Linux

Robotics & Vision: ROS 2, OpenCV, YOLO, Arduino

EXPERIENCE

Xsolla | AI Software Engineer Intern **Aug 2026 – Present**

- Built the all-in-one platform for Xsolla's 100-person AI internship program, used by ~200 interns, mentors, and project owners across 9 offices (React, TypeScript, Node.js, PostgreSQL)
- Owned the platform as a project admin: led 4 intern developers and triaged and fixed bugs from interns, mentors, and VPs
- Added a customizable LLM assistant that answers users' questions about any part of the platform, from onboarding and project matching to reviews & delivery tracking
- Integrated a configurable Slack notification system powering follow-ups across the platform, with per-notification schedules, recipient lists, and manual send backups (Google Cloud Run), doubling weekly progress-report submissions from 148 interns and mentors
- Designed a company-wide AI-assisted hiring platform that screens and scores Lever applicants, currently driving the 30-intern hiring push for a newly launched office, with role- and region-based access enforced through PostgreSQL row-level security
- Extended an AI agent that plays 34 mobile games for monetization research from Android to iPhones on a 12-device farm (Python, Appium), and built a human review tool that creates its evaluation dataset

McGill University: Desautels | Web Systems Assistant (Part-Time) **May 2026 – Present**

- Refactored legacy web pages to meet WCAG accessibility standards, and mapped 1000+ URLs for a site migration

Freelance | Full-Stack Engineer **May 2025 – Aug 2026**

- Built an API that automated product creation for 650 books on Books Galore's new Next.js and Sanity storefront by pulling metadata and pricing from the Google Books and Open Library APIs, cutting listing time from ~40 minutes to seconds per product
- Consulted Save the Shea Tree on their site architecture, then built it with Next.js and a headless Sanity CMS

City of Brampton | STEM Instructor **Sept 2023 – Aug 2024**

- Taught 6 STEM programs, from early-years robotics to high-school full-stack development, to 200+ students, and mentored 30+ projects

PROJECTS

ARGM: Autonomous Chess-Playing Robot | GitHub **Dec 2025 – Present**

- Built a computer vision pipeline (OpenCV, YOLO) that localizes a physical chessboard and classifies occupancy for all 64 squares using HSV color statistics, confirming moves by majority vote across 17 frames
- Detected human moves, including castling, en passant, and promotion, by comparing stable camera frames, and generated the robot's replies with the Stockfish engine
- Designed a ROS 2 architecture with custom message types that turns engine moves into ordered pick-and-place steps, with arm actuation in progress
- Developing Arduino (C++) firmware and a Rust serial driver to control the robotic arm.

LEADERSHIP

McGill Women in Computer Science (McWiCS) | Hackathon Director **Sept 2026 – Present**

- Directing the annual hackathon with an expected 150 participants, and secured sponsorships from Google DeepMind and Squarepoint
